I. INTRODUCTION

The project Cottonwood Multi-family Residential Development is an approximately 9.4 acres site located approximately 600 feet east of the intersection of Perris Blvd and Cottonwood on the north side of Cottonwood Avenue in the City of Moreno Valley, Riverside County, California (see attached vicinity map). The site is bordered to the west by single family homes that have a chain linked fence along the boundary, to the south by Cottonwood Avenue, to the north by single family homes that contain a chain linked fence and single-family residential home to the east with a block wall.

II. DESCRIPTION OF THE ONSITE CONDITIONS

The site topography appears to have a low spot at the southeast corner of the property. There is an estimated 6 foot of elevation differential across the site. The existing flows drains into an existing inlet that is in the public right of way just north of Cottonwood Avenue. This inlet is the ultimate outfall of the site and is connected into the Riverside County Flood Control District Sunnymead Line P.

The site will be developed into attached multi-family homes. The site will contain twenty-three residential building a multi-purpose building and pool, and two recreational areas. Each residential building will contain 8 dwelling units. 10 building's (80 units) will have approximately 730 sq ft footprint. 13 buildings (104 units) will have approximately 1,090 sq ft footprint.

This hydrology report looks at the project at the ultimate condition.

III. OFFSITE HYDROLOGY

Cottonwood residential development will receive offsite flows. Along the northerly property line where the two streets of Bencliff Avenue and Tacoma Dr end. Topography appears to have those two streets drain north to south. A third street, Birchwood Dr. flows north to south as well. The project is proposing to connect Birchwood Dr to Cottonwood Ave. so drainage will continue through. Patricia Lane along the northeast property line is fully developed with curb and gutter with block walls being along the easterly property line. The HGL line in the existing 96" storm drainpipe in Cottonwood Avenue according to the as-builts appears to be above the pipe itself but not protruding above the ground. The offsite flow before development naturally flows through the site to the two existing catch basins along Cottonwood Ave. The current HGL line shown in the as-builts takes this flow into consideration already. The post mitigation development flow entering the existing storm drain line will be less than or equal to the current flow entering the system therefore, the HGL line will not change, and no back water will occur.

IV. ONSITE HYDROLOGY

The project is proposed to use multiple biofiltration basins throughout the project, to mitigate added flows generated by the additional impervious surface. The project will use minimal inlets and storm drainpipes needed to direct the flow to the basin. To calculate the flows that will be generated by the project site, CIVILCADD/CIVIL DESIGN software was used. The tables below summaries the calculations:

The project will increase the post Q amount. To mitigate the increase of flow coming from the project, multiple modular wetland systems with upstream storage with the capacity to store up to a volume of 70,059 c.f. Per the attached geotechnical report, infiltration is not feasible for this project.

The project offsite from areas OS-1 and OS-2 will routed through the project site and into Sunnymead Line P in Cottonwood Avenue.OS-3 and OS-4 will also go into Sunnymead Line P in the proposed new connection to Sunnymead Line P in Watson Way. The offsite flow will enter the proposed catch basins being proposed on Watson Way, into the proposed 24" storm drain line and then tie into the existing 96" storm drain line. The existing offsite flow and flow from Watson Way would naturally drain to the existing catch basin along Cottonwood Avenue that leads into the existing 96" SD line. Therefore, the existing SD system already accounts for these flows and the HGL line will not change or be affected by the potential slight increase in flow from the areas now being developed.

V. CONCLUSION

In conclusion, this report demonstrates that the proposed development is designed to not increase runoff and poses no flood risk to public & the downstream neighboring properties. The proposed storm drains, and the biofiltrations basins are designed to convey the flow rates indicated hereon and will comply with the flood protection and storm water quality requirements of the County of Riverside.

¹ Precipitation frequency (PF) estimates in this table are based on frequency analysis of partial duration series (PDS).

Numbers in parenthesis are PF estimates at lower and upper bounds of the 90% confidence interval. The probability that precipitation frequency estimates (for a given duration and average recurrence interval) will be greater than the upper bound (or less than the lower bound) is 5%. Estimates at upper bounds are not checked against probable maximum precipitation (PMP) estimates and may be higher than currently valid PMP values.

Please refer to NOAA Atlas 14 document for more information.

The following loss rate calculations reflect use of the minimum calculated loss

rate subtracted from the Storm Rain to produce the maximum Effective Rain value

The following loss rate calculations reflect use of the minimum calculated loss

rate subtracted from the Storm Rain to produce the maximum Effective Rain value

The following loss rate calculations reflect use of the minimum calculated loss

rate subtracted from the Storm Rain to produce the maximum Effective Rain value

User entry of depth-outflow-storage data

Total number of inflow hydrograph intervals = 290
Hydrograph time unit = 5.000 (Min.)
Initial depth in storage basin = 0.00(Ft.)

Initial basin depth = 0.00 (Ft.)
Initial basin storage = 0.00 (Ac.Ft)
Initial basin outflow = 0.00 (CFS)

 Depth vs. Storage and Depth vs. Discharge data:
